| Week | Date    | Topic                                 | Reading                | Assignments - Due 11pm* |
|------|---------|---------------------------------------|------------------------|-------------------------|
| 1    | 8/24/26 | L1. Introduction & GPS Basics         | PNT Ch 1, ME 2.1 & 2.2 |                         |
|      | 8/26/26 | L2. Navigation Measurements & Methods | ME Ch 1                |                         |
|      | 8/28/26 |                                       |                        | HW1 Assigned            |
| 2    | 8/31/26 | L3. GPS Signal Structure              | ME Ch 2, PNT Ch 2      |                         |
|      | 9/2/26  | L4. Coordinate Frames                 | ME Ch 4.1, 4.A         |                         |
|      | 9/4/26  |                                       |                        | HW1 Due, HW2 Assigned   |
| 3    | 9/7/26  | Labor Day (no class)                  |                        |                         |
|      | 9/9/26  | L5. Orbits & Visibility               | ME Ch 4.3              |                         |
|      | 9/11/26 |                                       |                        | HW3 Assigned            |

# Outline

- GPS Signal Components – focus on legacy signals
- Carriers
- Codes – Purpose, characteristics, generation, modulation onto carriers
- Navigation data – Purpose, content, organization, combining with codes
- **Reading Assignment**
  - ME Ch 2, problems 2-1 and 2-2 and PNT Ch 2
- **Questions to think about**
  - What features of GPS are enabled by the codes?
  - Why 2 frequencies?
  - How does a receiver find a specific GPS satellite?

# GPS Signal Components

Base frequency is  $f_0 = 10.23 \text{ MHz} = 10,230,000 \text{ Hz}$  (cycles/sec)

Carriers – Sinusoids

- $L1 = 154 f_0 = 1575.42 \text{ MHz}$
- $L2 = 120 f_0 = 1227.6 \text{ MHz}$
- $L5 = 115 f_0 = 1176.45 \text{ MHz}$

Codes – Known sequence of 0's and 1's, transmitted at known times

Legacy Codes:

- **C/A code: chip rate** =  $f_0 / 10 = 1.023 \text{ Mcps (MHz)}$ , **length** = 1 ms
- P code: chip rate =  $f_0 = 10.23 \text{ Mcps (MHz)}$ , 37 weeks long, each satellite gets a 1 week segment

Legacy Navigation Data

- Data rate = 50 bps, 20ms per bit, 6 s per subframe, 30 s for individual satellite data  
12.5 min for all

# GPS Spectrum

UNITED  
STATES  
FREQUENCY  
ALLOCATIONS  
THE RADIO SPECTRUM

GPS

From [https://www.rolia.com/wp-content/uploads/2021/07/GNSS\\_Spectrum\\_11x17\\_11-14-2019-1.pdf](https://www.rolia.com/wp-content/uploads/2021/07/GNSS_Spectrum_11x17_11-14-2019-1.pdf)

# **CODES: Three Functions of PRN Codes**

## **1. Satellite ID**

- Each satellite transmits a different PRN code sequence

## **2. CDMA – Code Division Multiple Access**

- Interference suppression among satellite signals
- PRN code spreads the spectrum of each signal into a wider bandwidth
- Receiver recovers a specific satellite's signal by de-spreading process

## **3. Receiver-Satellite range measurement**

- PRN code phase is a measure of signal transmission time

# What is a PRN code?

Noise-like digital sequence:

- Deterministic
- Important auto & cross correlation properties
- Has a large bandwidth or spread spectrum

Code as 0's and 1's

Code as +1/-1

# CORRELATION FUNCTION $R_{xy}(\tau)$

- Correspondence between a code and a phase-shifted replica of another code
- Cross correlation – correspondence between different codes:  $R_{xy}(\tau)$
- Autocorrelation - correspondence of code w/phase shifted version of itself  $R_x(\tau)$

$$R^{j,k}(n) = \sum_{i=1}^{1023} x^j(i) x^k(i+n), \text{ for good cross-correlation } \approx 0, j \neq k$$

$$R(n) = \sum_{i=1}^{1023} x^j(i) x^j(i+n), \text{ for good auto-correlation } \approx 0, n \neq 0$$

- Simple idea: Compare shifted code replica with the original reference.  
If just a binary code, number of bits that agree minus the number of bits that disagree is the correlation.

# CORRELATION CALCULATION - EXAMPLES

Cross correlation between two different codes for  $\tau = 0$  (no shift):

|                                   |
|-----------------------------------|
| 10011110111010001001101111111101  |
| 000010001010011100001110010010001 |

Every time the numbers agree, add 1.

Every time the numbers disagree, subtract 1.

|                                   |
|-----------------------------------|
| 10011110111010001001101111111101  |
| 000010001010011100001110010010001 |

14 agree

19 disagree

Total score: -5

Perfect agreement would be 33

Normalized correlation:  $-5/33$

# Calculating Autocorrelation $R(\tau)$

| SHIFT | CODE    | AGREE | DISAGREE | AUTOCORRELATION |
|-------|---------|-------|----------|-----------------|
| REF   | 1110010 | -     | -        | -               |
| 0     | 1110010 | 7     | 0        | 7               |
| 1     | 0111001 |       |          |                 |
| 2     |         |       |          |                 |
| 3     |         |       |          |                 |
| 4     |         |       |          |                 |
| 5     |         |       |          |                 |
| 6     |         |       |          |                 |
| 7     |         |       |          |                 |

# How are PRN codes generated?

- Tapped Feedback Shift Register

| A | B | Y |
|---|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| 0 | 1 | 1 |
| 1 | 1 | 0 |

n stage shift register tapped at [3,n]

# GENERATING A CODE

- Example: Generate the PRN code for a 3 stage shift register tapped at [3,2] starting from an all ones state.

| Shift | Stage |   |   | Code |
|-------|-------|---|---|------|
| T     | 1     | 2 | 3 |      |
| 0     | 1     | 1 | 1 |      |
| 1     |       |   |   |      |
| 2     |       |   |   |      |
| 3     |       |   |   |      |
| 4     |       |   |   |      |
| 5     |       |   |   |      |
| 6     |       |   |   |      |
| 7     |       |   |   |      |

# MAXIMAL LENGTH CODES

- Maximal length codes are the longest codes that can be generated by a given number of shift register stages. For an  $n$ -stage shift register, the longest code is  $2^n - 1$  chips (i.e. 1's or 0's).
- Maximal length codes have many interesting properties, especially their autocorrelation function.
- For a maximal length code, the autocorrelation function for a phase shift other than 0 or  $(2^n - 1)$  is -1.
- For any code, the autocorrelation for a 0 shift is equal to the number of chips in the code.

# GPS C/A CODES (From Misra & Enge, Problem 2.1)

# PRN 5 CODE SEQUENCE (shown as +/- 1's)

# Autocorrelation of PRN 5 C/A Code

# Computing a cyclic correlation

```
function P = cyc_corr_basic(x,y)
% Function to compute the cyclic correlation for ASEN 5090
% First input is the "received" signal
% Second input is the "replica" signal - this is the one that shifts

n = length(x);
x = reshape(x,1,n);          % make sure x is a row vector
yshifted = reshape(y,n,1);   % make the replica of y a column vector

lag = [0:n]; Rxy = NaN(size(lag));

for i = 1:length(lag) % sweep the lag from 0 to n
    Rxy(i) = x*yshifted;
    yshifted = [yshifted(end); yshifted(1:end-1)];
end
plot(lag,Rxy, '.', lag,Rxy, '-'), grid, xlim([0 n])
xlabel('LAG'), ylabel('CORRELATION')
```

# Cross correlation between shifted PRN5 & reference PRN 5

```
xshifted = x([end-99:end 1:end-100];  
cyc_corr_basic(xshifted,x)
```

# Pseudorange

GPS transmitted C(A)-code

Receiver replicated C(A)-code

$\Delta t$

- $\Delta t$  is proportional to the GPS-to-receiver range
- Four pseudorange measurements can be used to solve for receiver position

# GPS Satellite CA Code Phase Assignments

| PRN # | Phase selection | Code delay | 1 <sup>st</sup> 10 chips (Octal) |
|-------|-----------------|------------|----------------------------------|
| 1     | $2 \oplus 6$    | 5          | 1440                             |

| 37    | $4 \oplus 10$   | 950        | 1713                             |

PRN# 33-37 are reserved for ground transmitters to validate system operation and accuracy

# Impact of Correlation Properties

- What makes a useful code?
  - For ranging:
  - For CDMA:
  - For acquisition:

# How are GPS PRN codes sent on a carrier signal?

GPS uses BPSK - (Bi-phase shift keying)  
Sequence of "1's" and 0's" that specify  
when phase of carrier should be  
reversed (1) or left alone (0).

Can consider as a sequence of **0's and 1's**  
OR **+1 and -1's**

- In terms of phase-shift keying:  
0 = "don't shift"  
1 = "shift by 180 deg"
- In terms of amplitude modulation:  
multiplying by "1" keeps the carrier  
multiplying by a "-1" inverts it

# Binary Phase Shift Keying (BPSK) Modulation

Radio wave carrier:  $s_c(t) = A \cos(\omega_c t + \varphi)$  (1)

BPSK modulated version is:  $s_{cm}(t) = A \cos(\omega_c t + \varphi + \theta(t))$  (2)

Bi-phase modulation:  $\theta(t) = 0$  or  $\pi$

$$s_{cm}(t) = \begin{cases} A \cos(\omega_c t + \varphi) & \theta(t) = 0 \\ -A \cos(\omega_c t + \varphi) & \theta(t) = \pi \end{cases} \quad (3)$$

BPSK modulation  $\leftrightarrow$  Binary Amplitude Shift Keying:

$$s_{cm}(t) = p(t) A \cos(\omega_c t + \varphi) \quad (4)$$

$$p(t) = 1 \text{ or } -1$$

# BPSK Signal Transmission and Recovery

## Transmitted from SV

## Recovered by Receiver

# Effect of PRN Code Modulation on Spectrum

- LEGACY GPS

- PRN codes have a  $\text{sinc}^2$  spectrum
- Main lobe is 2x chipping rate
- Side lobes are 1x chipping rate
- Power density is very low
